P3 Reflection

What question in your domain does each capstone query answer?

The first query shows how many users got a specific result, the second shows the number of attempts per user, and the third shows how many users chose a profile picture.

What did you have to fix or change after testing?

No, but I think that is because of the practice I got on lab 4.

If you used AI, what did AI get right/wrong, and how did you verify the result?

I used ChatGPT a bit, mainly to understand errors. I would take its suggestions and play around until I got the result I wanted.
